PORTFOLIO | 2026

Devanshi Soni

Frontend Developer

Ahmedabad, India | Open to junior roles and internships

devasoni889@gmail.com github.com/devanshisoni123

ABOUT ME

I'm a self-taught frontend developer, mostly by building things until they broke and then working out why. What I love most is problems: finding what is broken and fixing it myself. I'm a B.Com graduate, now pursuing my MCA, and still building the whole way through. I'm looking for my first junior role or internship.

PROJECTS AT A GLANCE

PROJECT	TYPE	MY ROLE	STATUS
PetalPages	Full-stack web app	Frontend and backend, built end to end	Live
Nagomi	Japanese learning platform	Frontend (complete) and backend (in progress)	Frontend complete, backend in progress
Aerdola	5-page brand website	Designed and built from scratch (freelance client project)	Live
CoreSoft	Company website	Frontend, responsive (freelance client project)	Live
Ankur EditX	Client portfolio website	Frontend (freelance client project)	Live, client confirmed

WHAT I BUILD

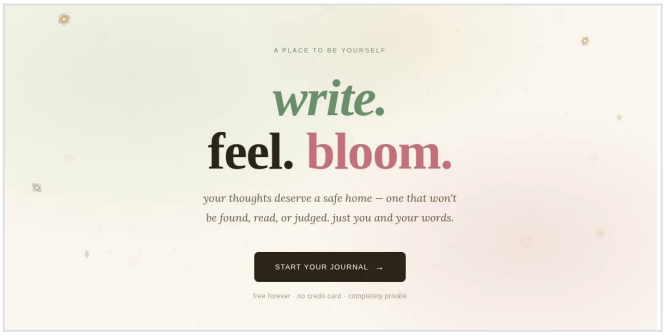

Five projects: two full-stack applications I am building for myself (PetalPages and Nagomi) and three websites delivered for real clients (Aerdola, CoreSoft and Ankur EditX). Each page that follows explains what the project is, why I built it, and what it can do.

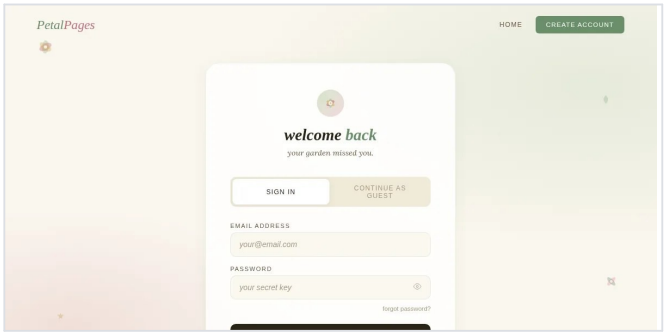

PROJECT 01

PetalPages

Full-stack web app

LIVE

OVERVIEW

A private journaling web app for young women. It gives the writer a calm space that is only theirs: write something, close the page, come back later. I built every layer myself, from the interface to the server and database behind it, and deployed it so anyone can open it.

WHY I BUILT IT

I wanted a journaling space where thoughts feel safe: private by design, never found, read or judged by anyone. I also wanted to take one idea all the way from interface to a deployed backend, instead of stopping at the frontend.

KEY FEATURES

- Private journal entries: create, read, edit and delete
- Notes section for quick thoughts
- Period tracker
- Register and sign-in secured with JWT authentication, plus a guest option
- Settings page and an 11-page, calm cream-and-sage design with serif typography
- Separate frontend and backend, each deployed on its own host

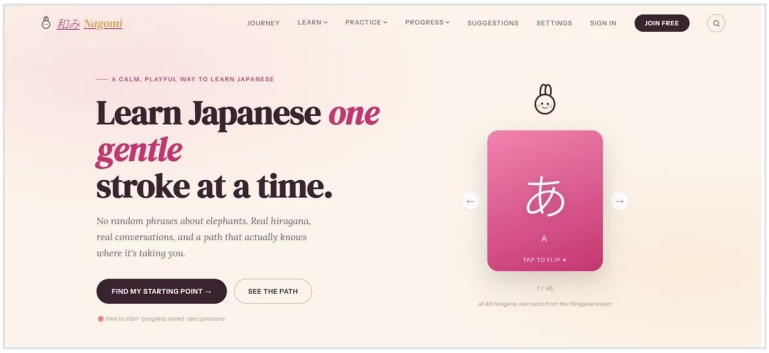

ROLE	Frontend and backend, built end to end
TECH	HTML, CSS, JavaScript | Java, Spring Boot | MySQL | JWT authentication
HOSTING	Frontend on GitHub Pages, backend on Railway
LIVE LINK	devanshisoni123.github.io/petalpages/

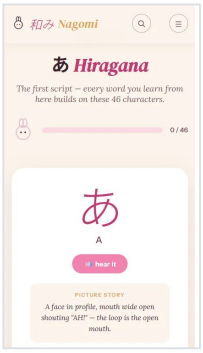

PROJECT 02

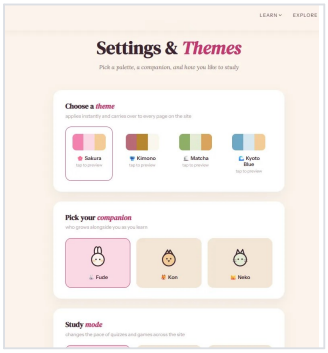

Nagomi

Japanese learning platform

FRONTEND COMPLETE, BACKEND IN PROGRESS

OVERVIEW

A 24-page Japanese learning platform built around one idea: learn Japanese one gentle stroke at a time. A bunny mascot named Fude guides learners through kana, kanji, vocabulary, grammar, games and stories. The frontend is finished and demo-ready; the backend is being built now.

WHY I BUILT IT

I wanted a Japanese-learning companion that feels structured instead of random: real hiragana, real conversations and a clear path that knows where the learner is going. It grew from a small Kana Garden idea into the full Nagomi build, and I am finishing it one piece at a time, interface first and server second.

KEY FEATURES

- Hiragana (46 characters), Katakana and 106 N5 Kanji with on and kun readings
- Vocabulary flashcards, 20 grammar points and 300 basic phrases in 10 categories
- Tracing, audio ("hear it") and mock quizzes inside each learning section, with a progress counter and picture-story memory aids
- Games hub: Kana Match, Speed Quiz, Falling Kana and Word Builder
- Dialogue mode with branching scenes, plus Smart Review
- Story mode with 6 stories (tooltips and quizzes) and a learning-journey roadmap
- Dashboard, progress stats and achievement badges
- Culture section: 6 topics, each with 8 facts and a 4-question quiz
- Settings for theme (Sakura, Kimono, Matcha, Kyoto Blue), mascot companion (Fude, Kon or Neko) and study mode
- Site-wide search, mobile menu and preferences saved with localStorage
- Backend requirements document covering 11 feature areas

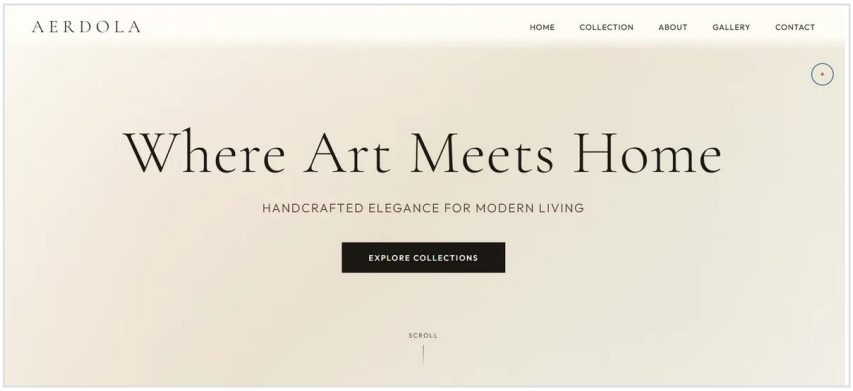

ROLE	Frontend (complete) and backend (in progress)
TECH	HTML, CSS, JavaScript | Spring Boot and JWT backend (scaffolding underway)
HOSTING	Frontend demo-ready; backend being built
LIVE LINK	Not live yet (backend in progress)

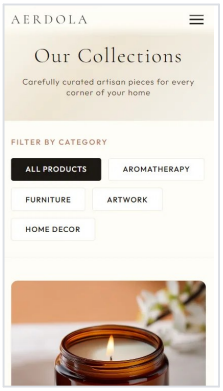

PROJECT 03

Aerdola

5-page brand website

LIVE

OVERVIEW

A complete five-page brand website, built from scratch. The brand's promise, "Where Art Meets Home - handcrafted elegance for modern living", sets the tone: clean design, modern typography and a smooth experience across devices.

WHY I BUILT IT

A brand needs a first impression that feels as considered as what it sells. The goal was a quiet, elegant site where refined typography and generous space do the talking, and that feels equally good on a phone and a desktop.

KEY FEATURES

- Five pages: Home, Collection, About, Gallery and Contact
- Elegant hero with a clear "Explore Collections" call to action
- Collection page with category filters: All Products, Aromatherapy, Furniture, Artwork and Home Decor
- Modern serif and sans-serif typography on a clean, minimal layout
- Responsive design that adapts smoothly to phones, tablets and desktops
- Built from scratch with no template

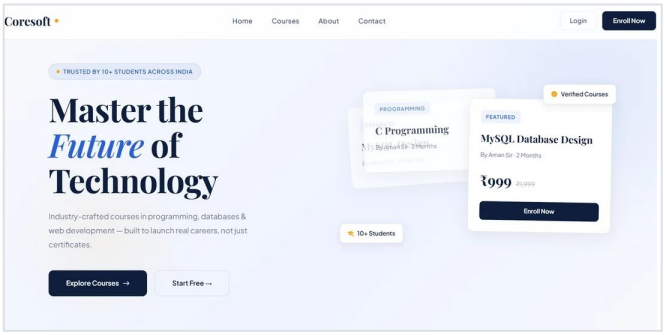

ROLE	Designed and built from scratch (freelance client project)
TECH	HTML, CSS, JavaScript
HOSTING	Live on Netlify
LIVE LINK	aerdola.netlify.app/

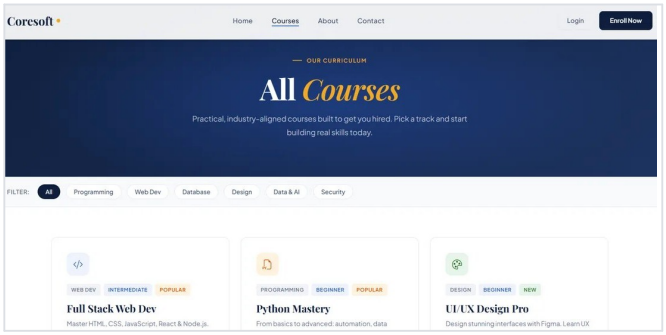

PROJECT 04

CoreSoft

Company website

LIVE

OVERVIEW

A clean, modern website for a software company. The headline, "Master the Future of Technology", leads into industry-crafted courses in programming, databases and web development. It is responsive, fast-loading and built to look credible to tech clients.

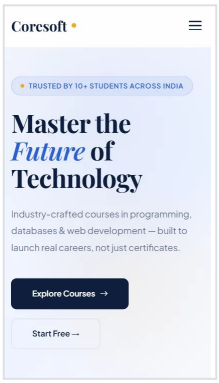

WHY I BUILT IT

Tech clients judge a company within seconds. The site had to load quickly, look professional on any screen and make the next step, enrolling, obvious.

KEY FEATURES

- Hero with clear "Enroll Now", "Explore Courses" and "Start Free" calls to action
- Course catalogue with category filters: Programming, Web Dev, Database, Design, Data and AI, Security
- Course cards showing level, tags and price
- Trust signals such as verified courses and student numbers
- Pages: Home, Courses, About and Contact
- Responsive layout and fast loading

MOBILE VIEW

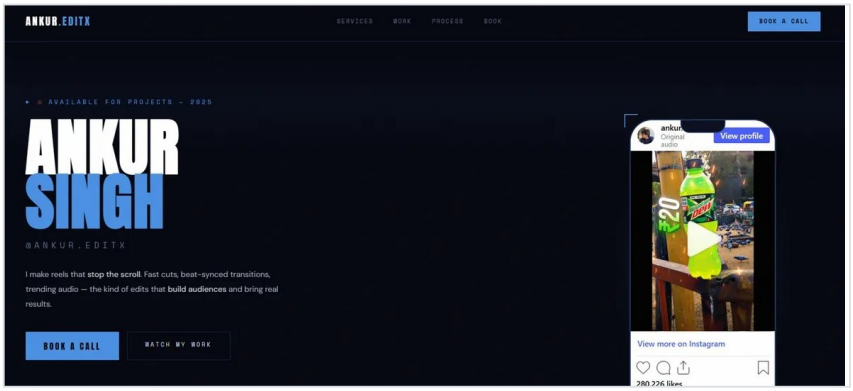

ROLE	Frontend, responsive (freelance client project)
TECH	HTML, CSS, JavaScript
HOSTING	Live on Netlify
LIVE LINK	coresoftfuture.netlify.app/

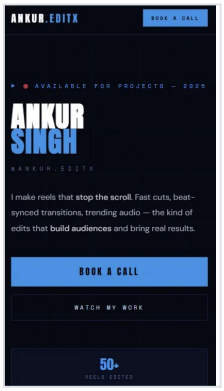

PROJECT 05

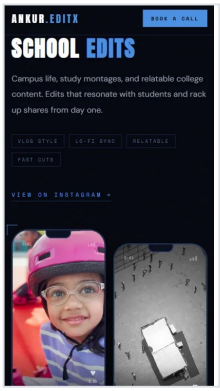

Ankur EditX

Client portfolio website

LIVE, CLIENT CONFIRMED

OVERVIEW

A dark-themed portfolio website for Ankur Singh, a reel editor, built for a real client. It shows his work with an Instagram embed and makes it easy to get in touch through a booking contact form.

WHY I BUILT IT

A video editor's website has to feel as sharp as his edits. The brief was bold, high-contrast and built to turn visitors into bookings, with his real reels front and centre.

KEY FEATURES

- Bold dark theme with a large typographic hero
- Instagram embed that shows his real reels on the page
- "Book a Call" and "Watch My Work" calls to action, plus a "50+ reels edited" highlight
- Work grouped by style, such as School Edits, with tags like vlog style and lo-fi sync
- Booking contact form
- Responsive layout for phones and desktops

ROLE	Frontend (freelance client project)
TECH	HTML, CSS, JavaScript
HOSTING	Live on Netlify
LIVE LINK	ankureditx.netlify.app/

Skills and journey

TOOLKIT

Core	HTML, CSS, JavaScript, Bootstrap
Signature method	Responsive design
Backend and data	Java, Spring Boot, MySQL, JWT authentication, Python
Tools and hosting	Git (learning), GitHub, GitHub Pages, Netlify, Railway
Learning next	React JS

JOURNEY

2026	Completed a B.Com degree while teaching myself frontend development.
Along the way	Built Aerdola, CoreSoft and Ankur EditX for real clients.
Now	Building PetalPages and Nagomi, learning Git and pursuing an MCA.

Let's work together

I'm open to junior roles and internships. If you'd like to see more or talk about an opportunity, get in touch.
